Program-1

Implement Vacuum cleaner problem for 2 rooms ,any type of agent can be considered simple reflex or model based etc.

Algorithm:

Implement vacuum cleaner agent

function REFLEX-VACUUM-AGENT([location, status]) returns action
  if status = Dirty then return Suck
  else if location = A then return Right
  else if location = B then return Left

Code:

```
def vacuum_world():
 # initializing goal_state
 # 0 indicates Clean and 1 indicates Dirty
    goal_state = {'A': '0', 'B': '0'}
    cost = 0
    location_input = input("Enter Location of Vacuum") #user_input of
location vacuum is placed
    status_input = input("Enter status of " + location_input) #user_input
if location is dirty or clean
    status_input_complement = input("Enter status of other room")
    print("Initial Location Condition" + str(goal_state))
    if location_input == 'A':
    # Location A is Dirty.
        print("Vacuum is placed in Location A")
        if status_input == '1':
            print("Location A is Dirty.")
     # suck the dirt and mark it as clean
            goal_state['A'] = '0'
            cost += 1 #cost for suck
            print("Cost for CLEANING A " + str(cost))
            print("Location A has been Cleaned.")
            if status_input_complement == '1':
    # if B is Dirty
                print("Location B is Dirty.")
                print("Moving right to the Location B. ")
                cost += 1 #cost for moving right
```

```
            print("COST for moving RIGHT" + str(cost))
            # suck the dirt and mark it as clean
            goal_state['B'] = '0'
            cost += 1 #cost for suck
            print("COST for SUCK " + str(cost))
            print("Location B has been Cleaned. ")
        else:
            print("No action" + str(cost))

Program-8

Implement unification in first order logic

Algorithm:

Algorithm:

Step 1: Begin by making the substitute set empty

Step 2: Unify atomic sentences in a recursive manner:

a. Check for expressions that are identical

b. If one expression is a variable $v\psi_i$, & the other is a term t_i which does not contain variable v_i, then:

a. Substitute t_i/v_i in the existing substitutions

b. Add t_i/v_i to the substitution setlist

c. If both the expressions are functions, then function name must be similar, & the number of arguments must be the same in both the expressions

Code:

```
import re
def getAttributes(expression):
    expression = expression.split("(")[1:]
    expression = "(".join(expression)
    expression = expression.split(")")[:-1]
    expression = ")".join(expression)
    attributes = expression.split(',')
    return attributes

def getInitialPredicate(expression):
    return expression.split("(")[0]
def isConstant(char):
    return char.isupper() and len(char) == 1

def isVariable(char):
    return char.islower() and len(char) == 1
def replaceAttributes(exp, old, new):
    attributes = getAttributes(exp)
    predicate = getInitialPredicate(exp)
    for index, val in enumerate(attributes):
```

```python
        if val == old:
            attributes[index] = new
    return predicate + "(" + ",".join(attributes) + ")"

def apply(exp, substitutions):
    for substitution in substitutions:
        new, old = substitution
        exp = replaceAttributes(exp, old, new)
    return exp
def checkOccurs(var, exp):
    if exp.find(var) == -1:
        return False
    return True

def getFirstPart(expression):
    attributes = getAttributes(expression)
    return attributes[0]

def getRemainingPart(expression):
    predicate = getInitialPredicate(expression)

    if not remainingSubstitution:
        return []

    return initialSubstitution + remainingSubstitution
def main():
    print("Enter the first expression")
    e1 = input()
```

```
    print("Enter the second expression")
    e2 = input()
    substitutions = unify(e1, e2)
    print("The substitutions are:")
    print([' / '.join(substitution) for substitution in substitutions])
main()
```

Output:

```
Enter the first expression
knows(y,f(x))
Enter the second expression
knows(nithin,N)
The substitutions are:
['nithin / y', 'N / f(x)']
```

Proof:

Proof :

Here, predicate is same

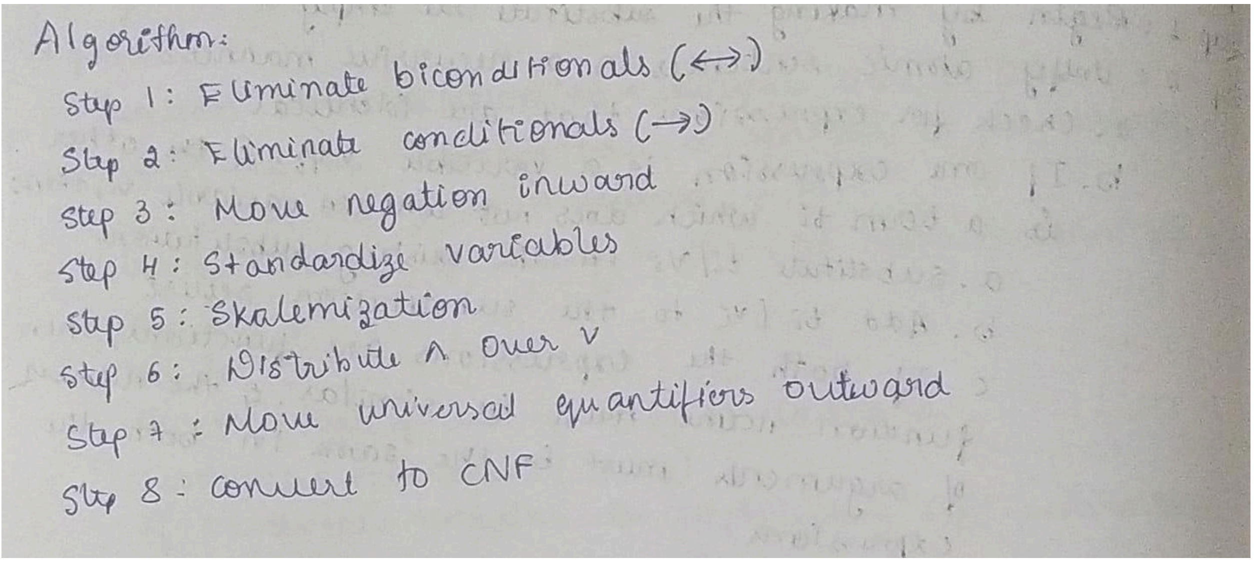
So, by replacing y with nithin, we can unify both statements

Replace f(x) with N, unification is possible

Program-9

Convert a given first order logic statement into Conjunctive Normal Form (CNF).

Algorithm:



Algorithm:

Step 1: Eliminate biconditionals (⟷)
Step 2: Eliminate conditionals (⟶)
Step 3: Move negation inward
Step 4: Standardize variables
Step 5: Skalemization
Step 6: Distribute ∧ over ∨
Step 7: Move universal quantifiers outward
Step 8: Convert to CNF

Code:

    print("Enter FOL:")
    fol = input()
    print("The CNF form of the given FOL is: ")
    print(Skolemization(fol_to_cnf(fol)))
main()
```

Output:

```
Enter FOL:
food(x)=>likes(pooja,x)
The CNF form of the given FOL is:
~food(x)Vlikes(pooja,x)
```

Proof:

Proof :

food(x) $\Rightarrow$ likes(pooja, x)

Remove conditionals by using

if $P \rightarrow Q$

then $\sim P \vee Q$.

$\therefore$ $\sim$food(x) $\vee$ likes(pooja, x)

Program-10

Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

Algorithm:

Algorithm:

Step 1 : Initialize the knowledge base (KB):
- Start with an empty KB
- Add known FOL statements to the KB

Step 2 : Initialize Agenda:
- create an agenda to store statements to be processed
- Add known facts & rules with satisfied antecedents

Step 3 : Repeat until convergence or query is answered:
- while the agenda is non empty;
  - Pop a statement from the agenda
  - If the statement is the query, return 'Query is true'
  - If the statement is a fact or a known truth:
    - Skip to the next iteration
  - If the statement is a rule with satisfied antecedents:
    - Apply the rule to generate a new consequent
    - Add the new consequent to the agenda

Step 4 : Termination
- If the agenda is empty & the query is not answered, return 'Query is false'

Code:

```
import re
